

Human Being from Conception

DAY 1. Human life begins at the moment of conception. It is when many features of the child are determined. These are: sex, the colour of eyes, hair and skin, height, good health or tendency to certain diseases.

DAY 2. The heart of the child starts beating. The brain is formed.

WEEK 6. Child's spine and bones are formed. Kidneys, lungs, liver and heart already function. Electromagnetic signals transmitted by human brain can be registered.

WEEK 10. All the body organs function. Child's little hands and feet have been formed. There are papillary ridges on child's fingers. The child reacts to external stimuli, e.g. it feels pain. From this point on all the body organs only need to improve their efficiency and the child needs to grow and put on weight.

WEEK 12. The child can gather up its little legs, turn its feet, and straighten out its toes as well as clench its fist and raise its brows. Child's uniqueness can be seen in child's build and in its behaviour. The child is sensitive to its mother's emotions and reacts to them.

WEEK 40. The child is born after 9 months of life in its mother's womb.
